CENTRAL FAX CENTER****JUL 25 2007****AMENDMENTS TO THE CLAIMS**

1. (currently amended) A method of creating a ring tone file, comprising the acts of:
receiving on a handset an electronic data file comprising a master audio
recording;
receiving on the handset a ring tone start designation for a first time during an
output of the master audio recording;
receiving on the handset a ring tone stop designation for a second time during the
output of the master audio recording;
creating a ring tone file from a portion of the electronic data file defined by the
start designation and the stop designation, the ring tone file solely comprising a
temporally contiguous portion of the master audio recording; and
making the ring tone file available for selection by a user.
2. (original) The method of claim 1, wherein the ring tone stop designation comprises an
elapsed time after the ring tone start designation.
3. (original) The method of claim 1, wherein the step of receiving on the handset the
electronic data file comprises receiving the electronic data file via a wireless signal.
4. (original) The method of claim 1, further comprising:
associating the ring tone file with an input communication source.
5. (original) The method of claim 4, wherein the step of associating the ring tone file
with the input communication source comprises associating the ring tone file with one of
a paging system and a telephone system.
6. (original) A computer-readable storage medium encoded with a computer program
which, when loaded into a processor, implements the method of claim 1.

50T5474.01

7. (currently amended) A handset comprising:
- a processor;
 - a memory coupled to the processor;
 - a user interface coupled to the processor; and a user-defined ring tone file stored in the memory, wherein the stored ring tone file is defined by the user entering a ring tone start designation for a master audio recording data file and by the user entering a ring tone stop designation for the master audio recording data file and the ring tone file solely comprises a temporally contiguous portion of the master audio recording data file.
8. (original) The handset of claim 7, wherein the ring tone stop designation comprises an elapsed time after the ring tone start designation.
9. (original) The handset of claim 7, wherein the handset comprises a wireless handset.
10. (original) The handset of claim 9, wherein the wireless handset comprises one of a cellular phone, a personal digital assistant, and a pager.
11. (original) The handset of claim 7, wherein the user-defined ring tone file is associated with an input communication source.
12. (original) The handset of claim 11, wherein the input communication source comprises one of a paging system and a telephone system.
13. (original) The handset of claim 12, wherein the telephone system comprises a multiline system.
14. (currently amended) A method of manufacturing a wireless handset, comprising the acts of:
- configuring the handset to receive an electronic data file comprising a master audio recording;

50T5474.01

configuring the handset to receive a first user input, wherein the first user input enables the user to input a ring tone start designation for a first time during an output of the master audio recording;

configuring the handset to receive a second user input, wherein the second user input enables the user to input a ring tone stop designation for a second time during the output of the master audio recording;

configuring the handset to create a ring tone file from a portion of the electronic data file defined by the start designation and the stop designation, the ring tone file solely comprising a temporally contiguous portion of the master audio recording; and

configuring the handset to make the ring tone file available for selection by the user.

15. (original) The method of claim 14, wherein the ring tone stop designation comprises an elapsed time after the ring tone start designation.

16. (original) The method of claim 14, wherein the step of configuring the handset to receive the electronic data file comprises configuring the handset to receive the electronic data file via a wireless signal.

17. (original) The method of claim 14, further comprising:

configuring the handset to associate the ring tone file with an input communication source.

18. (original) The method of claim 17, wherein the step of configuring the handset to associate to the ring tone file with the input communication source comprises associating the ring tone file with one of a paging system and a telephone system.
